Key Partners	Key Activities	Value Propositions	Customer Relationships	Customer Segments
Contract manufacturers (Vergent). Technology partners (NVIDIA, AWS). Real estate operators (early adopters validating ROI). Installer Networks	Hardware design, manufacturing, and certification. AI software development and continuous improvement. Standardized installs via certified electricians. Data aggregation, reporting, and ROI proof for customers. Building case studies that drive portfolio expansion.	Cost reduction & control: 10–30% reduction in common area and tenant-facing energy costs, directly improving NOI. Plug-and-play intelligence: Works with both older “dumb” buildings and newer systems, no complex retrofits required. Portfolio-level visibility: Granular, actionable reporting across multiple properties for asset managers.	Direct sales to portfolio companies: Sell to the property manager or building engineer at a single site, where energy bills are a real pain point. Land-and-expand model: Use successful deployments in one building to prove value and open doors to other properties in the same portfolio.	Primary: Mid- to large-sized multifamily apartment building operators (100k+ sq ft, typically 100–300 units). Decision-makers: Property managers, asset managers, REIT portfolio operators.
	Key Resources Proprietary Intelligent Energy Hub (hardware + AI OS). Installation playbooks and contractor network. Sales pipeline with property operators. Early pilot deployments as proof points	Future-ready: Scales to integrate solar, batteries, EV charging when building owners or tenants adopt them. Valuation uplift: Demonstrated \$30K+/year per building potential savings → higher NOI → stronger cap rates.	Channels • Direct sales to building managers and operators. • Expansion within portfolios after initial site success (land and expand). • Introductions via real estate networks, property associations, alumni connections.	Pain points: • Rising utility costs (20–25% YoY). • Inability to bill back utilities due to new regulations (e.g., Colorado). • Pressure to improve Net Operating Income (NOI) and asset valuation. • Need for simple, non-technical solutions across diverse building stock.
Cost Structure • Hardware production and installation. • R&D and software development. • Sales and distribution. • Cloud hosting and AI compute. • Customer support and reporting.		Revenue Streams Hardware sales: One-time per hub. Recurring SaaS: Monthly/annual subscription (\$10K–15K ACV/building). Optional upside: Revenue share on demand flexibility, future data monetization.
