

Module 7: Legal Questions

Questions	Answers
What is your legal (corporate) structure (e.g. C Corp, S Corp, LLC)?	SPARK AI Inc. is a Delaware C Corporation.
Are you aware of any corporate or equity structural issues that could be a problem down the road, in particular to investors or partners? How will you address them?	There are no known structural issues. Equity is cleanly divided among founders, with no outstanding convertible instruments or debt. We are working with legal counsel to ensure early equity is properly documented and vesting schedules are in place to support institutional investment.
Do you own your IP? If not, do you have an exclusive license for your IP?	All core intellectual property has been developed by SPARK. We are currently formalizing IP ownership and protection with a legal team and our mentor who is an IP attorney.
Is your IP defensible? How do you know?	The core IP combines a modular edge hardware hub with a proprietary AI coordination layer for building-to-grid orchestration. This intersection of local hardware, real-time negotiation protocols, and multi-stakeholder intent modeling is unique and not addressed by existing BMS, vendors.
What patent landscape analysis or prior art search have you done or had done?	An initial prior art scan was conducted internally and reviewed with legal counsel to evaluate white space around AI intent modeling for energy usage and edge-based decision layers. No conflicting patents were identified.
What patents, if any, have you applied for?	We are in the process of filing a provisional patent covering the modular Intelligent Energy Hub, the intent parsing interface, and its distributed coordination protocol for real-time load and DER management.
How does your IP help to give you a sustainable competitive advantage? (examples could be to charge higher prices, ability to capture market share rapidly, lower costs, exclusivity, fewer competitors, etc)	SPARK enables building energy usage to become programmable and responsive without expensive retrofits. Our IP allows us to charge a premium for intelligence-as-a-service, access grid revenue streams, and rapidly scale across buildings using a low-cost, plug-and-play approach.
What is your IP strategy going forward?	We plan to file additional patents covering our negotiation and override protocols, AI training dataset pipeline, and software-defined logic layers. We will protect trade secrets where appropriate and pursue patents for core platform primitives with potential licensing value.
